

Project Proposal
A Example of Mock: The Simple Pendulum
Adam Handwerger
STAT673

I will train the MOCK model with the state space system of the simple pendulum. There will be 15 trajectories which will correspond to 15 different initial angles. All trajectories will start from rest. At the end, the model will be tested by producing 5 trajectories from random initial angles. A short discussion will be including discussing data simulation and hyperparameter tuning. These results will then be compared to the case when the sampling frequency for the training set is doubled.
